

Low-cost approach for a 3D-visualization of historical structures in *Metropolis* (Ionia)

Sebastian Lemstra (University of Applied Sciences Karlsruhe)

Boris Dreyer (Friedrich-Alexander University Erlangen-Nuremberg)

Mark Vetter (University of Applied Sciences Karlsruhe)

Where is Metropolis?

Data collection (Scans)

Kinect© as a low-cost 3D-Scanner

Data collection (Scans)

Bending of a model because of a low point accuracy

Data collection (Images)

Average Smartphone for
collecting color data

Data collection (Images)

Optimal
image for texturing

Texturing: Image Registration

Positions of the cameras

Texturing: Color Projection

Texturing the model: detailed view on a bench of the bouleuterion

Time-based splitting

Byzantine wall was erected through the middle of bouleuterion

Time-based splitting

Bouleuterion without
the byzantine wall

Visualization: Tool-Requirements

Visualization of the data: Which tool to use?
→ define requirements

Visualization: Georeference

- Problem:
 - too many digits for each value
- Only GIS support georeferenced
 - No online functionality for 3D
- Option: local system, correct dimensions

Visualization: 3D-Hop

Conclusion

- Low-cost visualization is possible
- Quality of collected data has the biggest influence on quality of the result
 - Limited scan distance of the Kinect
 - Images should meet quality criteria
- 3D-Hop best solution for a visualization
- Low variety on software tools

Thank you for your attention.
