The Internet! Is that thing still around? Core concepts for modern cartography

Michael Peterson

University of Nebraska at Omaha
Gastprofessor an der TU Wien

The Internet has drastically changed the distribution and presentation of maps. Maps have quickly evolved from static displays to highly interactive and engaging forms of information delivery. They have also become a cornerstone of the Internet search engine. As a result of the early computerization of cartography, maps are a central element of the Internet – and it would be hard to imagine this form of communication without them. Through a series of quotes and illustrations, the core concepts are explored that underlie the transition to this new era in cartography.

Der Vortrag wird in Deutsch gehalten.

21. Juni 2011, 16 Uhr

Seminarraum 126 der Forschungsgruppe Kartographie
Erzherzog-Johann-Platz 1, 1040 Wien
